PERSONNEL				**Inspection #**		
Teams are required to have an Electrical Safety Officer.			**Initial ins.**	**1st reins.**	**2nd reins.**	**3rd reins.**
AI.1.1	Identify the Electrical Safety Officer (ESO)	Ask for the ESO				
AI.1.2	Only team members involved in technical inspection can be in the technical inspection bay	Ask for non-essential people to leave the area				
DO NOT PROCEED WITH TECHNICAL INSPECTION IF THE ESO IS NOT PRESENT						

INSTRUCTIONS FOR SCRUTINEERS

This section applies to Electric Vehicles (EV) and Autonomous Vehicles (AV) and Dual Purpose Vehicles.
If an item is acceptable, initial the "Passed" column.
If an item is unacceptable, initial the "Reinspect" column and inform the team members they have not meet the requirements for that item.
Teams are allowed to take their vehicle away from technical inspection and address any issues before representing for reinspection.
Scrutineers may continue with the inspection when unacceptable items are found, provided it is safe to do so.
Teams are required to pass all items before the vehicle can proceed to the Brake Test or compete in Dynamic Events.

Scrutineers reserve the right to refuse to proceed with Technical Inspection if a sufficiently serious issue which might jeopardize the safety of the technical inspection team, event personal or any other persons is found at any time.

EV CLASS - ACCUMULATOR INSPECTION

SAFETY EQUIPMENT AND TOOLS

Teams are expected to have appropriate safety equipment and tools to allow them to work on their vehicle.
All safety equipment and tools must be in good usable condition, and comply to Australian industry best practice standards.
There must be a sufficient quantity of appropriate safety equipment (PPE) for everyone who needs to work on electrical systems.
Insulated tools must be rated and appropriately marked as complaint to DIN/IEC 60900 (VDE 1000V), or an equivalent recognized standard.
Improvised or repaired tools using heat shrink, tape or similar are not acceptable. Modified tools are not acceptable.

				Reinspect	Passed
AI.2.1	Safety Glasses	At least one pair per team member working on electrical systems. Safety Glasses should be non-conductive (non-metallic).	Inspect		
AI.2.2	HV Insulating Gloves	HV Isolating gloves with leather outers. Gloves must comply with AS2225 or ASTM D120 or AS IEC 60903 The inner gloves must have been tested in the last 12 months and be free from damage or punctures. Outer gloves must be in serviceable condition. Gloves must be labelled with a working voltage, higher than the vehicle's maximum battery voltage. At least one pair per team member working on electrical systems. Size of the gloves should be appropriate for those conducting the work. Note: Class 00 gloves are rated for up to 500V, Class 0 gloves are rated for up to 1000V.	Inspect 		
AI.2.3	HV Isolating Blanket	Two HV Isolating Blanket (at least 0.83 square meter) Blanket must be in good condition and free from punctures or tears. Blanket must be labelled with a working voltage, higher than the vehicle's maximum battery voltage.	Inspect		
AI.2.4	HV Insulated Tools	Check the team has an appropriate set of tools to maintain the vehicles electrical systems. These must include as a minimum all of the following: - Insulated cable shear - Insulated screwdrivers - Insulated pliers - Multimeter with protected probe tips (CATIII 600V or better) - A pair of quality insulated 5mm banana test leads (600V rated or higher)	Inspect		
AI.2.5	Additional Insulated Tools	If the accumulator uses bolted connections the team must also present tools appropriate for manipulating the selected fasteners such as: - Insulated spanners - Insulated socket set - Insulated Allen keys (hex wrenches) - Any other special tools required to maintain the accumulator and other electrical systems safely	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

CHARGING TROLLEY				Reinspect	Passed
AI.3.1	TSACHC Wheels	The hand cart must have at least two wheels. Appropriately rate to take the load of the accumulator and cart.	Inspect		
AI.3.2	TSACHC Brake	The hand cart must have a brake which acts on at least 2 of the wheels that is always on and only released if someone pushes the handle, or similar. The brake must be capable of safely stopping the fully loaded hand cart.	Inspect		
AI.3.3	TSACHC Accumulator Mounting	Accumulator must be securely attached to the hand cart to enable safe transportation.	Inspect		
AI.3.4	TSACHC Labels	The label on the TSACHC must include The vehicle number, the university name, and the ESO phone number(s) must be displayed and written in Roman characters of at least 10mm high on the lid or top of each TSACHC. The characters must be clearly visible and placed on a high-contrast background.	Inspect		

BATTERY CHARGER INSPECTION Only chargers presented and sealed at technical inspection are allowed.				Reinspect	Passed
AI.4.1	Battery Charger	Charger needs to be professionally built. All connections of the charger(s) must be insulated and covered. No open connections are allowed.	Inspect		
AI.4.2	Battery Charger Wiring	Battery Charger Power lead must be free of any damage, nicks, cuts, grease or grime. The plug shall be suitably rated for the current load and conforming to EN 60309-2, AS/NZS 3123, Charger shall have a valid test and tag sticker or tag attached.	Inspect		
AI.4.3		HV wires must be marked with gauge, temperature rating and voltage rating, serial number or norm is also sufficient, if the team shows the datasheet in printed form.	Inspect		
AI.4.4		Wire temperature, current and voltage rating must be suitable for use in the charger	Inspect		
AI.4.5		Using only insulating tape or rubber-like paint for insulation is prohibited.	Inspect		
AI.4.6		The AC power supply to the battery charger and other associated devices must include a residual current device (RCD) with over current protection (fuses or an appropriate circuit breaker) or residual current circuit breaker (RCBO). The RCD or RCBO device must act to disconnect both the active and neutral supplies. The trip sensitivity of the RCD must not exceed 30mA. Where possible 10mA is preferred.	Inspect		
AI.4.7		Traction System charging leads must be orange.	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

				Reinspect	Passed
BATTERY CHARGER INSPECTION CONTINUED... Only chargers presented and sealed at technical inspection are allowed.					
AI.4.8	Charging system measuring points	Two charging system voltage measuring points must be provided on the charger output lines.	Inspect		
AI.4.9		The measuring points must be protected from being touched with the bare hand/fingers once the housing is opened.	Inspect		
AI.4.10		4mm shrouded banana jacks rated to a voltage higher than the maximum tractive system voltage must be used	Ask the team to provide a datasheet		
AI.4.11		The Charger System Measurement Points must be protected by body protection resistors per EV6.8.4	Inspect		
AI.4.12		The Charger System Measuring Points must be marked with HV+ and HV-	Inspect		
AI.4.13	Battery Charger Emergency Stop	The charger must include a push-type emergency stop button which has a minimum diameter of 25mm and must be clearly labelled. The Pushbutton must be easy to reach with the accumulator in place.	Inspect		
AI.4.14		When the E-stop is pressed, the output from the charger must be electrically disconnected from the battery, and the output from the charger must fall to less than 60 V in 5 seconds. The shutdown method must be implemented using a positive switching circuit (Contactor, relay contacts, etc.) which is opened if the charger shutdown button is pressed, or the charger is disconencted from the accumulator.	Inspect		
AI.4.15		The international electrical symbol consisting of a red spark on a white-edged blue triangle must be affixed in close proximity to this switch	Inspect		
AI.4.16	Battery Charger Earthing	The battery charger, accumulator and accumulator charging trolley, and any associated metallic components must be equipotentiality bonded and connected to the AC power supply earth such that the RCD function is not impeded. Cables used for earthing must be yellow/green stripped and at least 2.5mm^2 cross section.	Inspect		
AI.4.17	Battery Charger Galvanic Isolation	The charger DC output must be galvanically isolated from the AC input. Interfaces to external devices (such as laptops via serial or USB) must be galvanically isolated from the AC input and from the DC output	Inspect Ask the team to provide a datasheet, schematic or similar evidence		
AI.4.18	Touch Protection	It must not be possible to touch any live components of the charger with a 100mm long, 6mm diameter insulated test probe when the covers are in place. All output and interface plugs must be touch protected.	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

				Reinspect	Passed
ACCUMULATOR INSPECTION Accumulator technical inspection will inspect the accumulator outside of the vehicle in the designated battery room. Teams are expected to bring the necessary tools for the safe opening of the accumulator for inspection. All accumulators will be physically inspected.					
AI.5.1	Accumulator Ready For Inspection	Using approporate safe work practices, remove covers from accumulator and remove segment links.	Ask team to perform		
AI.5.2	Accumulator Construction	HV Accumulator(s) must be enclosed in container(s).	Inspect		
AI.5.3		The bottom of the accumulator must be steel of minimum thickness 1.25mm or Aluminum of minimum thickness 3.2mm. Walls (internal and external) and cover/top, must be Steel of minimum thickness 0.9mm or Aluminum of minimum thickness of 2.3mm. If alternative material used, they should present proof of equivalency (per SES or other) with a sample.	Inspect		
AI.5.4		All components and parts of the accumulator container need to be properly fixed. Internal cables and components must not be able to move around causing chafing, stress to connections, or other damage.	Inspect		
AI.5.5		Fasteners in the tractive system high current path must have a positive locking mechanism. The locking mechanism must be suitable for use at a minimum operating temperature of 90 degrees C. Bolts with nylon patches are acceptable only for blind holes and where used per OEM design. Any bolt which may pose a risk of fire or short circuit if loosened must utilise a positive locking mechanism.	Inspect		
AI.5.6		The accumulator cells must be secured from moving in the event of an impact. This includes if the accumulator in inverted. Generally friction fitting is not sufficient and some positive retention is required. If the accumulator lid is used as a method to retain the cells, it must be reinforced and robustly attached.	Inspect		
AI.5.7		Internal vertical walls must be robustly fastened to the container	Inspect		
AI.5.8		If the accumulator container is made from an electrically conductive material, the poles of the accumulator stack(s) and/or cells must be insulated against the inner wall of the accumulator container, if the container is made of electrically conductive material. There must be an insulating barrier between the accumulator walls and any electrically live component within. This usually means that all of the internal walls of the accumulator needs to be lined with an appropriate insulating material.	Inspect		
AI.5.9		Holes in the accumulator external structure should be of the minimum practical size for cable passages, plugs etc. Holes for ventilation should be circular, no greater than 10mm in diameter, and not obviously weaken the accumulator container external structure. When installed in the vehicle, the holes must not face towards the driver with the firewall removed.	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

ACCUMULATOR INSPECTION CONTINUED...				Reinspect	Passed
AI.5.10	Labelling	Accumulator must be marked with the ISO7010-W012 symbol triangle with black lightning bolt on yellow background) with triangle side length of 100 mm minimum, with text "ALWAYS ENERGIZED" If accumulator voltage is greater than 60VDC must also be Labelled as "HIGH VOLTAGE" Labelling should be on all practical external sides including top, bottom, front, rear, sides. Smaller labels accepted only if surface too small for defined size.	Inspect		
AI.5.11	Internals - cell connection	Contacting / interconnecting the single cells by soldering in the high current path is prohibited. Soldering wires to cells for the voltage monitoring input of the BMS is allowed	Inspect		
AI.5.12		Connections to cell tabs must be adequately supported to prevent damage to the cells. Cables, busbars etc. must not be supported entirely by the cell tabs.	Inspect		
AI.5.13	Internals – AIR/fuse	Every accumulator container must contain at least one main fuse and at least two accumulator insulation relays. There must be no electrically live connection to the accumulator cells outside of the accumulator enclosure when the AIRs are open. This includes AMS wires. AIRs must be rated for the maximum expected current draw. The AIRs and main fuses must be separated from the cell segments by an electrically insulated and non flammable material.	Inspect		
AI.5.14	Internals – fuses	The fuse(s) must be appropriately rated to protect the cable(s) and other electronic components. Fuses should be HRC type and marked with a DC voltage rating above the maximum expected operating voltage. Except where specifically stated in the rules, all small wiring connecting directly to the cells or tractive system should have appropriate fuses as close as possible to the source. Fusible links are acceptable but require evidence of appropriate voltage and current rating. Teams may justify undersized (current only) fuses based on average current draw and the manufacturer's thermal time curves.	Inspect		
AI.5.15	Internals - maintenance plugs	Maintenance plugs or similar measures have to be taken to allow separating the internal cell stacks in a way, that the separated cell stacks carry a voltage of less than 120VDC and a maximum energy of 6MJ. The separation has to affect both poles of the stack. It must not be possible to incorrectly install the maintenance plugs causing a short circuit.	Inspect		
AI.5.16	Internals – cell stack barriers	Each stack has to be electrically insulated by the use of suitable material towards other stacks in the container and on top of the stack. Air is not considered to be a suitable insulator for this purpose. The team should provide evidence that the material(s) used are appropriate (i.e. material datasheets, manufacturer's specifications, lab test reports etc.). Team manufactured composite materials are not acceptable (carbon fibre, Kevlar, fiberglass etc.).	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

ACCUMULATOR INSPECTION CONTINUED...				Reinspect	Passed
AI.5.17	Accumulator container connectors	If HV-connectors of the accumulator containers can be removed without the use of tools, a pilot contact/interlock line has to be implemented which breaks the current through the AIRs whenever the connector is removed	Inspect		
AI.5.18	Indicator light/voltmeter	Each container must have an indicator light or an analogue voltmeter showing that voltages greater than 60V DC are present outside of the container. This includes when the accumulator is being charged.	Inspect		
AI.5.19	Equalizing valve	If the container is completely sealed, it must have an equalizing valve to prevent integral build up of pressure in the event of fire.	Inspect		
AI.5.20	Electrical Connections	Electrical connections must be secure and of high quality. Connections must be made using appropriate hardware, correct sized lugs for selected cable, appropriate crimping methods etc. Electrical connections must not be able to loosen if they become hot. Electrical connections which rely on plastic or similar material being squeezed, which might soften and become loose if overheated are not acceptable. Information about the electrical connections supporting the high current path must be available at Elect Tech Inspection.	Inspect		
AI.5.21	Precharge and Discharge Resistors	Precharge and discharge resistors must be installed such that if they overheat, it is unlikely they will cause any of the accumulator cells to overheat. If the team has elected to utilize precharge or discharge or discharge resistors with a continuous operation (not monitored by the PDOC per local addendum), the resistors must installed according the manufacturer's recommendations for heatsinking airflow, and such that heat soak cannot cause the accumulator cells to overheat.	Inspect		
AI.5.22	Accumulator Internal Wiring	All wires inside the accumulator must be marked with gauge, temperature rating and voltage rating, serial number or norm is also sufficient, if the team shows the datasheet in printed form.	Inspect		
AI.5.23		Wire temperature and voltage rating must be suitable for use in the accumulator. All Wires (including GLV and AMS/BMS) wires within the accumulator container must be rated for the full tractive system voltage.	Inspect		
AI.5.24		Using only insulating tape or rubber-like paint for insulation is prohibited.	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

ACCUMULATOR INSPECTION CONTINUED...				Reinspect	Passed
AI.6.1	Plastic and 3D printed Components	Any plastic components which are critical to the integrity of the accumulator (structural elements, bolt locking devices, insulation, barriers etc.) must be manufactured from materials which have a glass transition temperature higher than the expected operation temperature. The operating temperature is considered to be the calculated maximum cable or busbar temperature, maximum battery temperature or pre-charge or discharge resistor operating temperature, or 90 degrees C whichever is higher.	Inspect		
AI.6.2	Spare accumulator(s)	Spare Accumulators must be of the same type (construction, voltage, capacity, weight, fixing etc.) Only applicable if spare accumulators are used.	Inspect		
AI.6.3	Temperature monitoring equipment	Teams will be provided with a thermally sensitive sticker to install into their accumulator. The thermally sensitive sticker must be mounted such that it is direct thermal contact with the negative most cell of an accumulator segment such that it the thermal sticker will reasonably represent the temperature od the cells. The sticker should be visible from outside the accumulator without needing disassembly of the accumulator. (2025 only - refer inaccessible stickers to Technical Inspection Captain for review)	Inspect		

EV CLASS - ACCUMULATOR INSPECTION

NOTES

INSTRUCTIONS FOR SCRUTINEERS - END OF EV ACCUMULATOR INSPECTION
If the team have passed all items in this section, go to the second page of this document and initial the relevant box, noting the date and time the team passed this section. If the team have items requiring reinspection (did not pass all items), go to the second page of this document and initial the relevant box noting the time and date the team was released from the inspection. The team will need to rectify the reinspection items and may return for reinspection when they are ready. Reinspection is completed on a first come, first served basis, and is dependent on Technical Inspection lane availability. Teams with Scheduled Inspections times will be given priority over teams presenting for reinspection. Once the team have been released from the inspection, make note of the team's progress on the central inspection record board.

INSTRUCTIONS FOR SCRUTINEERS

This section applies to Electric Vehicles (EV) and Autonomous Vehicles (AV) and Dual Purpose Vehicles.
If an item is acceptable, initial the "Passed" column.
If an item is unacceptable, initial the "Reinspect" column and inform the team members they have not meet the requirements for that item.
Teams are allowed to take their vehicle away from technical inspection and address any issues before representing for reinspection.
Scrutineers may continue with the inspection when unacceptable items are found, provided it is safe to do so.
Teams are required to pass all items before the vehicle can proceed to the Brake Test or compete in Dynamic Events.

Scrutineers reserve the right to refuse to proceed with Technical Inspection if a sufficiently serious issue which might jeopardize the safety of the technical inspection team, event personal or any other persons is found at any time.

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION

The primary purpose of the Vehicle Visual Inspection is to find and highlight any items which might cause a safety hazard for the drivers, team members, track marshals and anyone else who might interact with the vehicle.
The hazards most associated with EV tractive systems include fire, arc flash, electric shock or loss of control. The Visual Inspection is intended to check that the vehicle has been designed and constructed to an acceptable standard such that the likelihood of one of these hazards causing injury is minimized. Scrutineers are not generally concerned with the reliability of the vehicle unless the failure of a component or system might pose a safety hazard.
Scrutineers may also look for rules compliance issues. Rules non-compliances should be referred to the EV Technical Inspection Captain.
Because of the bespoke nature of the vehicles, Scrutineers reserve the right to reject vehicles for any reasonable safety concern based on their judgement, even if not specifically covered in this document.

				Reinspect	Passed
SI.2.1	Race Ready Condition	The vehicle should be fully assembled with the Accumulator in place and generally in race ready condition when presented to technical inspection. Inspection of incomplete vehicles may proceed with permission from the Technical Inspection Captain.	Inspect		
SI.2.2	Technical Inspection Access	The vehicle must be lifted/jacked onto stands such that all of the vehicles wheels are at least 100 mm and no more than 300mm above the ground. It must be possible to freely rotate the vehicle's wheels without the vehicle moving. Stands must be robust and the vehicle must be secure.	Inspect		
SI.3.1	Push Bar	A pair of HV insulating gloves with leather outers, a Multimeter and fire extinguisher must be attached. If a tool is needed to open the HVD this must also be attached to the push bar.	Inspect		
SI.4.1	High Voltage Disconnect	The HVD must be clearly marked with "HVD" in large, high contrast lettering and should be clearly visible to a Marshal as they approach the vehicle. The HVD label must be easily distinguishable from the vehicles other markings.	Inspect		
SI.4.2		It must be possible to disconnect the HVD without removing any bodywork	Inspect		
SI.4.3		If opening the HVD is possible without the use of tools, a pilot contact/interlock line has to be implemented which breaks the current through the AIRs whenever the connector is removed	Inspect		
SI.4.4		In ready to race condition it must be possible to disconnect the HVD within 10 seconds.	Ask the team to demonstrate		
SI.5.1	Tractive system protection	All tractive system connections outside of an enclosure must be appropriately insulated.	Inspect		
SI.5.2		It must not be possible to touch any tractive system connections with a 100mm long, 6mm diameter insulated test probe when the tractive system enclosures are in place	Inspect		
SI.5.3		Tractive System components and containers must be protected from moisture in the form of rain or puddles. Use of tape alone is not acceptable. Heatshrink must be approporately rated for the TS voltage and must be provided with aditioanl mechanical protection.	Inspect		

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION CONTINUED…				**Reinspect**	**Passed**
SI.6.1	Master Switches	The Tractive System Master Switch (TSMS), Grounded Low Voltage Master Switch (GLVMS) and (AV and Dual Purpose only) Autonomous System Master Switch (ASMS) on the right side of the vehicle. At the height of the drivers' shoulders. Rotary type, ON position with key horizontal. ON and OFF position must be clearly marked. Located right side of the vehicle at approx. driver's shoulder height, just behind main roll hoop. Not attached to removable bodywork. Must be easily actuated from outside the vehicle.	Inspect		
SI.6.2		All master switches must be a rotary type with a red removable key/handle	Inspect		
SI.6.3		GLVMS (LV Master switch) must be completely surrounded by an RED circle of min 50mm diameter Marked with international symbol (triangle with red lightning bolt on blue background).	Inspect 		
SI.6.4		TSMS (TS Master switch) must be completely surrounded by an ORANGE circle of min 50mm diameter Accompanied by the ISO 7010-W012 (triangle with black lightning bolt on yellow background).	Inspect 		
SI.6.5		The Tractive System Master Switch must have a lock or similar fitted which prevents insertion of the master key. The lock should be of the type commonly used in industry for "LOTO isolation". Use of a LOTO hasp or similar is acceptable if necessary provided it is secure. The key for the lock and the master keys should be in the custody of the ESO.	Inspect		
SI.7.1	HV warning stickers	Each housing/enclosure containing HV parts must be marked with the ISO7010-W012 symbol triangle with black lightning bolt on yellow background) If accumulator voltage is greater than 60VDC must also be Labelled as "HIGH VOLTAGE" Labelling should be on all practical external sides including top, bottom, front, rear, sides. Smaller labels accepted only if surface too small for defined size.	Inspect Check top, sides and bottom of enclosures		

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION CONTINUED…				Reinspect	Passed
SI.8.1	HV Wiring	All tractive system wiring outside electrical enclosures must be enclosed in separate orange nonconductive conduit or use an orange shielded cable	Inspect		
SI.8.2		The conduit or shielded cable must be securely anchored (at least) at each end so that it can withstand a force of 200 N without straining the cable and crimp, and must be located out of the way of possible snagging or damage. Take note of connections to motors, plugs carrying HV, and any entrances to accumulators, motor controllers, the TSMPs and any other HV enclosures	Inspect		
SI.8.3		Tractive system wiring must be shielded against damage by rotating and/or moving parts. All wiring must be sufficiently restrained such that it cannot come into contact with rotating and/or moving parts.	Inspect		
SI.8.4		TS wires and GLVS wires are clearly separated/do not run directly next to each other/bounded together by cable rods or in the same cable channel (ALLOWED ONLY FOR PILOT CONTACTS OR INTERLOCK SIGNALS)	Inspect		
SI.8.5		Using only insulating tape or rubber-like paint for insulation is prohibited.	Inspect		
SI.8.6		Heat-shrink type insulation used on tractive system components and cables may only be used inside rigid enclosures and must be labelled with voltage rating. Serial number or norm is also sufficient, if the team shows the datasheet in printed form.	Inspect		
SI.8.7		No soldering in high current path including cable lugs and connectors.	Inspect		
SI.8.8		Electrical connections must be secure and of high quality. Connections must be made using appropriate hardware, correct sized lugs for selected cable, appropriate crimping methods etc. Electrical connections must not be able to loosen if they become hot. Electrical connections which rely on plastic or similar material being squeezed, which might soften and become loose if overheated are not acceptable. Information about the electrical connections supporting the high current path must be available at Elect Tech Inspection.	Inspect		
SI.8.9		HV wiring must be entirely within the chassis (side impact structure, rear impact zone and roll envelope) except for cables to hub motors	Inspect		

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION CONTINUED…				Reinspect	Passed
SI.9.1	Tractive system measuring points	Two tractive system voltage measuring points and a GLVS ground point must be installed next to the master switches, right side of the vehicle, at shoulder height of the driver.	Inspect		
SI.9.2		The measuring points must be protected by a non-conductive waterproof housing which can be opened without tools. The use of simple plastic/rubber sealing plugs inserted into the measuring points is not acceptable as a waterproofing method.	Inspect		
SI.9.3		The measuring points must be protected from being touched with the bare hand/fingers once the housing is opened.	Inspect		
SI.9.4		4mm shrouded banana jacks rated to a voltage higher than the maximum tractive system voltage must be used	Ask the team to provide a datasheet		
SI.9.5		The TSMPs must be marked with HV+ and HV-	Inspect		
SI.10.1	GLV Ground Measuring Point	Must be positioned next to the TSMPs and must be marked with GND	Inspect		
SI.10.2	GLV Voltage	Measure GLVS voltage between GLVS battery positive Must be less than 60V DC	Ask team to demonstrate		
SI.10.3	Tractive System Voltage	Measure TS voltage at measurement points Must be less than 60V DC	Ask team to demonstrate		
SI.10.4	Discharge System	The discharge circuit has to be wired in a way that it is always active whenever the shutdown circuit is open. If a discharge circuit is used a low resistance can be measured between HV+ and HV- whenever the tractive system is de-activated. Measure resistance between HV+ and HV- with multi-meter. Must be 2*BPR+ Dis- Charge Resistor (GLVS must be off) Refer alternative discharge methods to the EV Technical Inspection Captain	Ask team to demonstrate		
SI.11.1	Insulation Measurement Test	The insulation resistance between the GLV Ground Measuring Point and TSMPs HV+ must be greater than 500 Ohms/Volt, calculated for the maximum TS voltage. The available measurement voltages are 250 V and 500 V. All vehicles with a maximum nominal operation voltage below 500 V will be measured with the next available voltage level. All teams with a system voltage of 500 V or more will be measured with 500 V.	Measure insulation resistance between GLV Ground and HV+		
SI.11.1		The insulation resistance between the GLV Ground Measuring Point and TSMPs HV- must be greater than 500 Ohms/Volt, calculated for the maximum TS voltage. The available measurement voltages are 250 V and 500 V. All vehicles with a maximum nominal operation voltage below 500 V will be measured with the next available voltage level. All teams with a system voltage of 500 V or more will be measured with 500 V.	Measure insulation resistance between GLV Ground and HV+		

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION CONTINUED...				Reinspect	Passed
SI.12.1	Shutdown Buttons	One shutdown button, push-pull or push-rotate-pull on each side behind the drivers compartment (height approx. driver's head), one in the cockpit and easily accessible by the driver in any steering wheel position while wearing gloves and wrist restraints	Inspect		
SI.12.2		Minimum diameter of shutdown buttons on the side is 40mm. Minimum diameter of shutdown button in the cockpit is 24mm	Inspect		
SI.12.3		The shutdown buttons are not allowed to be easily removable, e.g. mounted onto a removable body work	Inspect		
SI.12.4		All shutdown buttons marked with international symbol	Inspect 		
SI.12.5	Cockpit Shutdown Button	Cockpit master switchPull-ON, Push-OFF, or Twist-Pull-ON, Push-OFF alongside & unobstructed by steering wheel, easily reached by driver. Minimum 24mm diameter. Marked with international symbol	Inspect		
SI.12.6	Brake Over Travel Switch	Brake over travel switch must be secured and positioned behind the brake pedal such that it will be tripped before the master cylinders bottom out or any other stops are reached. The brake over travel switch must be robustly mounted and not be bent or damaged if an over-travel occurs.	Inspect If necessary, ask team to demonstrate by bleeding the brake circuit		
SI.12.7	Inertia switch	The device must be mechanically attached to the vehicle. It must be possible to demount the device so that its functionality can be tested by shaking it. Mounts including double sided tape, Velcro or similar are not acceptable.	Inspect		

EV CLASS - EV STATIC INSPECTION

VEHICLE VISUAL INSPECTION CONTINUED…				Reinspect	Passed
SI.13.1	Accelerator Pedal Position Sensor (APPS)	Accelerator Pedal must promptly return to original position, if not actuated	Inspect		
SI.13.2		At least two sensors must be fitted as APPS and must have seperate supply, ground and signal lines from the plausibility detection device	Inspect		
SI.13.3		The accelerator pedal must have a positive stop to prevent sensors from being mechanically overstressed	Inspect		
SI.13.4		Two springs must be used to return the throttle pedal to the off position and each spring must work with the other disconnected	Inspect		
SI.13.5	Brake System Encoder	A brake pedal position sensor or brake pressure switch must be fitted to check for plausibility	Inspect		
SI.13.6	Brake Master Cylinders	The brake system master cylinder must be actuated directly or by a mechanical connection. Use of Bowden cables or push-pull Bowden cables is not allowed. The first 90% of the brake pedal travel may be used to regenerate brake energy without actuating the hydraulic brake system. The remaining brake pedal travel must directly actuate the hydraulic brake system, but brake energy regeneration may remain active.	Inspect		
SI.14.1	Firewalls (EV specific requirements)	A firewall must separate the driver compartment from components of tractive system (including HV wiring). Brake parts and chassis as conductive paths are allowed to protrude through firewall. See T.1.9.3 Outboard wheel motors and associated cables and other components of the suspension members are excluded from this requirement.	Inspect		
SI.14.2		The side of the firewall facing the tractive system must be Aluminum with a minimum thickness of 0.5mm and must be deliberately earthed to the chassis ground point.	Inspect		
SI.14.4		The firewall's integrity must not be compromised by forces from the driver. I.e. the driver must not sit directly against the firewall and the driver's seat must not rely on the structural integrity of the firewall unless it is adequately reinforced.	Inspect

EV CLASS - EV STATIC INSPECTION

VEHICLE GROUNDING

It is expected that all conductive components within 100mm of the Tractive system will be appropriately grounded (electrically bonded to the GLV system ground).

1. By equipotential bonding the conductive parts within the vehicle, the hazard posed by touching a voltage gradient is reduced, and
2. By ensuring a conductive path back to the chassis ground common point, the likelihood of the IMD correctly detecting the fault and shutting off the vehicle is increased, reducing the period of time for which the hazard can be present.

Scrutineers will look for any conductive components which are in close proximity (within 100mm) of any tractive system component (HV) element, which could become live in the event of a failure of a component, breach of insulation or similar either from normal operation, or in the event of a collision.

Any wire, braid or similar used for vehicle grounding must be appropriately terminated, robustly mounted, and of sufficient size and mechanical strength for its purpose.

This test involves using a Fluke 289 Multimeter on the lo-ohm setting to ensure there is a low resistance connection from the item being tested in reference to the chassis ground test point. It is acceptable to subtract the resistance of the test leads if necessary. Teams may remove paint, resin or other coverings to expose a bare conductive surface if required.

Teams also have the option of measuring resistance via method of voltage drop using a 1 amp current source if necessary.

Measurements to the conductive component should be taken within 100mm of the tractive system or as close as practical. Teams may remove body panels and covers to demonstrate compliance if required.

The pass criteria are:

a. Electrically conductive parts 300 mOhms Examples: parts made of steel, (anodized) aluminum, any other metal parts

			Criteria		Reinspect	Passed
SI.18.1	Equipotential Bonding	Firewall(s)	300 mOhm

EV CLASS - EV STATIC INSPECTION

NOTES

INSTRUCTIONS FOR SCRUTINEERS - END OF EV ELECTRICAL TECHNICAL INSPECTION

If the team have passed all items in this section, go to the second page of this document and initial the relevant box, noting the date and time the team passed this section. Give the team their EV STATIC sticker - the team may proceed to the next inspection station.

If the team have items requiring reinspection (did not pass all items), go to the second page of this document and initial the relevant box noting the time and date the team was released from the inspection. The team will need to rectify the reinspection items and may return for reinspection when they are ready. Reinspection is completed on a first come, first served basis, and is dependent on Technical Inspection lane availability. Teams with Scheduled Inspections times will be given priority over teams presenting for reinspection.

Once the team have been released from the inspection, make note of the team's progress on the central inspection record board.

2025 Formula SAE-A Technical Inspection Sheet
EV FUNCTIONAL TEST

PERSONNEL Teams are required to have an Electrical Safety Officer.			**Initial ins.**	**Inspection #** **1st reins.**	**2nd reins.**	**3rd reins.**
FT.1.1	Identify the Electrical Safety Officer (ESO)	Ask for the ESO				
FT.1.2	Only team members involved in technical inspection can be in the technical inspection bay	Ask for non-essential people to leave the area				
DO NOT PROCEED WITH TECHNICAL INSPECTION IF THE ESO IS NOT PRESENT						

INERT VEHICLE (EV & AV CLASSES ONLY) The Vehicle must be in a condition which prevents unexpected energization of the HV electrical systems or movement of the tractive system			**Initial ins.**	**Inspection #** **1st reins.**	**2nd reins.**	**3rd reins.**
FT.1.3	Disable the HV Systems - High Voltage Disconnect (HVD)	Check the HVD is disconnected				
FT.1.4	Disable the HV Systems - Tractive System Master Switch (TSMS) Lock	Check the TSMS Lock is fitted and effective				
FT.1.5	(AV and Dual Purpose only) Disable the ASMS - Autonomous System Master Switch (ASMS) Lock	Check the ASMS Lock is fitted and effective				
DO NOT PROCEED WITH TECHNICAL INSPECTION IF HVD IS INSTALLED OR THE TSMS LOCK IS MISSING						

INSTRUCTIONS FOR SCRUTINEERS

This section applies to Electric Vehicles (EV) and Autonomous Vehicles (AV) and Dual Purpose Vehicles.
If an item is acceptable, initial the "Passed" column.
If an item is unacceptable, initial the "Reinspect" column and inform the team members they have not meet the requirements for that item.
Teams are allowed to take their vehicle away from technical inspection and address any issues before representing for reinspection.
Scrutineers may continue with the inspection when unacceptable items are found, provided it is safe to do so.
Teams are required to pass all items before the vehicle can proceed to the Brake Test or compete in Dynamic Events.

Scrutineers reserve the right to refuse to proceed with Technical Inspection if a sufficiently serious issue which might jeopardize the safety of the technical inspection team, event personal or any other persons is found at any time.

EV CLASS - FUNCTIONAL TEST

EV FUNCTIONAL TEST PREREQUISITES

This section of the Technical Inspection process is intended to ensure that the vehicle's mandated safety systems function as required by the rules.

The order of testing in this section is important as the safety of some of the later tests relies on the correct functioning of systems already tested. As such there is a hold point after the testing of the safety shutdown systems. If the safety shutdown systems do not function as intended, it will be necessary to stop testing and for teams to correct any issues.

Because this section requires the vehicle to be powered on, and will require the wheels to turn under power, the vehicle must have successfully passed all previous steps before proceeding. The Scrutineer must check that the vehicle has passed all required steps before proceeding.

The Technical Inspectors will supply a Fluke 289 multimeter and insulated banana test leads.

				Reinspect	Passed
FT.2.1	Vehicle ready for Functional Safety Test	The vehicle must have successfully passed the following inspection stages, with all reinspect items addressed and passed. - Accumulator Inspection - EV Electrical Inspection - Mechanical Inspection - Driver Egress	Check page 2 of this document and the stickers on the vehicle's nosecone		
FT.2.2	Race Ready Condition	The vehicle must be fully assembled with the Accumulator in place and generally in race ready condition when presented to technical inspection.	Inspect		
FT.2.3	Technical Inspection Access	The vehicle must be lifted/jacked onto stands such that all of the vehicles wheels are at least 100 mm and no more than 300mm above the ground. The driven wheels must be removed - It must be possible to freely rotate the vehicle's wheels/hubs without the vehicle moving. Stands must be robust and the vehicle must be secure.	Inspect		
FT.2.4	Line of Fire	The minimum possible number of team members and Scrutineers should be in the area when testing is being conducted. Keep people away from rotating wheels, hubs or other moving parts. Check tires for debris that could be thrown, or remove wheels from vehicle.	Inspect		
DO NOT PROCEED WITH THE FUNCTIONAL SAFETY TEST IF ANY OF THE ABOVE ARE NOT COMPLETE					
FT.2.5	Driver Egress	If any of the following tests requires a driver to be in the vehicle, the driver must be in full race gear, and it must be possible for the driver to egress the vehicle safely. e.g. The vehicle must not be on high stands.	Inspect		

EV CLASS - FUNCTIONAL TEST

AMS FUNCTION TEST				Reinspect	Passed
FT.3.1	Accumulator Management System Function	AMS must monitor the cell voltage of each cell	Activate AMS system and show measurement data of the AMS for each cell (e.g., via laptop)		
FT.3.2		AMS must monitor the temperature of at least 20% of cells in pack			
FT.3.3		A red indicator light marked “AMS” must be installed in the cockpit that lights up, if the AMS shuts down the car	Inspect		

TRACTIVE SYSTEM ENERGISATION TEST				Reinspect	Passed
ASK THE TEAM TO INSTALL THE HVD AND UNLOCK THE TSMS LOCKOUT. THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.4.1	GLVMS Function	TS only allowed to be powered up, when GLVS is powered up. Connect the Fluke 289 Multimeter to TSMPs and set to measure DC Voltage (600V range). Try to switch on Tractive System with GLVS Master switch in Off-Position. No voltage above 60VDC allowed at measurement points.	Ask team to demonstrate		
FT.4.2		TS only allowed to be powered up, when GLVS is powered up. Switch on Tractive System and then switch off GLVS Master switch. Tractive system must switch off as well - Watch measured voltage on scrutineer's Multimeter fall to below 60V DC.	Ask team to demonstrate		
FT.4.3	Pre-Charge Circuit	A circuit that is able to pre-charge the intermediate circuit to at least 90% of the current accumulator voltage before closing the second AIR has to be implemented. Use the graphing function of the Fluke 289 Multimeter to plot the voltage at the TSMPs during power up of the tractive system. Show that 90% voltage is reached before final AIR closes.	Ask team to demonstrate		
FT.4.4	Tractive System Voltage	The maximum tractive system voltage must be less than or equal to 600VDC at all times as measured by the Fluke 289 Multimeter. Measured Voltage:	Ask team to demonstrate		
FT.4.5	Accumulator Active Indicator	Accumulator Indicator Light or analogue voltmeter has to show if voltage above 60VDC is present outside of the accumulator container. Switch off the GLVMS. The Accumulator active indicator must continue to function even if the GLVMS is switched off or if the accumulator is removed from the vehicle.	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

TRACTIVE SYSTEM ENERGISATION TEST				Reinspect	Passed
		THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES			
FT.4.6	TSAL	The TSAL must be installed immediately under the highest point of the roll hoop. The TSAL must not be on top of the roll hoop. The TSAL must not touch the drivers helmet in any seating position.	Inspect		
FT.4.7		The TSAL must be continuously illuminated green in colour when the vehicle GLVMS is switched on but the voltage outside the accumulator is less than 60VDC	Inspect		
FT.4.8		Switch on the Tractive System. The TSAL must flash red in colour at between 2hz and 5Hz when the voltage outside the accumulator is more than 60VDC. The TSAL may stop functioning if the GLVMS is switched off.	Inspect		
FT.4.9		The TSAL must be clearly visible in bright sunlight to a person standing anywhere less than 3m from the vehicle with an eye height of 1.6m. The TSAL must not be blocked by wings or other bodywork. Minor obstruction from the roll hoop is acceptable.	Inspect		
FT.4.10		TSAL must be non-programmable. No part of the TSAL function must depend on a programmable device.	Ask Team to demonstrate		
FT.4.11	Discharge Circuit	A circuit that is able to discharge the tractive system components outside of the accumulator container to less than 60V DC withing 5 seconds of a shutdown must be fitted. Use the graphing function of the Fluke 289 Multimeter to plot the voltage at the TSMPs during power up of the tractive system. Show that the voltage falls to less than 60V DC in less than 5 seconds after the TSMS is switched off.	Ask team to demonstrate		
FT.4.12	PDOC	A red indicator light marked "PDOC" must be installed in the cockpit that lights up, if the PDOC system shuts down the car. The indicator light must be visible to the driver in bright sunlight. The PDOC may be omitted if the pre-charge and discharge circuit is designed for continuous operation in a faulted state and will not adversely affect nearby devices	Inspect		

EV CLASS - FUNCTIONAL TEST

INSULATION MONITORING DEVICE TEST

The IMD is one of the primary methods for monitoring the health of the accumulator and tractive system.
The IMD works by continuously measuring the insulation resistance between the tractive system and the chassis. If it detects a low resistance path between the tractive system and the chassis, it will shut down the vehicle. The IMD is intended to form a detection system, providing early warning to the team that they have an insulation breakdown before a short circuit can form.
The correct function of the IMD is critical to the operational safety of the vehicle and any misbehaviour should be reported to the EV Technical Inspection Captain for investigation.

				Reinspect	Passed
THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.5.1	IMD	A red indicator light marked "IMD" must be installed in the cockpit that lights up, if the IMD system shuts down the car. The indicator light must be visible to the driver in bright sunlight.	Inspect		
FT.5.2		The team must provide a test resistor manufactured with insulated banana plugs with an appropriate resistor in place. The resistor must have an approporate voltage and power rating and be encased in a hard shell enclosure. The resistor should have appropriate power rating and be installed in a hard shell enclosure (heat shrink/tape insulation is not acceptable). Check the resistance of the test lead with the Fluke 289 Multimeter. The resistance should be a minimum of: R_Test = (maximum TS voltage * 250Ω/V) - (2 * BPR) Measured Resistance: *BPR = the value of the Body Protection Resistors in Ohms	Inspect		
FT.5.3		Activate Tractive System and connect R_Test between HV+ and GLVS ground. TS voltage as measured at the TSMPs must decrease below 60VDC in 5 sec, IMD may take up to 30s to react. Observe with the Fluke 289 Multimeter.	Check Shutdown Time with Stopwatch		
FT.5.4		Activate Tractive System and connect R_Test between HV- and GLVS ground. TS voltage as measured at the TSMPs must decrease below 60VDC in 5 sec, IMD may take up to 30s to react. Observe with the Fluke 289 Multimeter.	Check Shutdown Time with Stopwatch		
FT.5.5		Remove the test resistor. The tractive system may not automatically return to active state after the IMD test resistor was removed or a BMS error disabled it. The Driver must not be able to reactivate the tractive system	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

SHUTDOWN SYSTEM TEST

This section proves the correct function of all shutdown devices.
The tractive system must fall below 60V within 5 seconds when the shutdown system is activated.
With the Fluke 289 Multimeter monitoring the voltage at the TSMPs, have the team turn on the vehicle's LV and Tractive System then activate the shutdown mechanism.
While completing this test, the items previously must continue to operate. Watch that the TSAL, Accumulator Active Indicator, precharge and discharge systems all continue to work correctly.

THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES

TAKE CARE NOT TO OVERHEAT THE PRECHARGE OR DISCHARGE RESISTORS DURING TESTS

				Reinspect	Passed
FT.6.1	Shutdown System Test	Vehicle with tractive system live --> GLVS master switch off	Ask team to demonstrate		
FT.6.2		Vehicle with tractive system live --> TS master switch off	Ask team to demonstrate		
FT.6.3		Vehicle with tractive system live --> Left shutdown button off	Ask team to demonstrate		
FT.6.4		Vehicle with tractive system live --> Right shutdown button off	Ask team to demonstrate		
FT.6.5		Vehicle with tractive system live --> Cockpit shutdown button off	Ask team to demonstrate		
FT.6.6		Vehicle with tractive system live --> Brake over travel switch off	Ask team to demonstrate		
FT.6.7		Vehicle with tractive system live --> GLVS master switch off	Ask team to demonstrate		
FT.6.8		Unmount inertia switch. Activate TS and shake the switch and check if TS is shutdown. TS is not allowed to reactivate without a manual reset e.g. by the driver	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

READY TO DRIVE TEST

This section tests the on-board systems which are intended to prevent the vehicle running away if a component fails.
The plausibility systems are expected to have a high degree of reliability and robustness as they may be the last line of defence from a collision.
This section will require that the team put the vehicle into drive, so the wheels and hubs will turn under power. Keep all unnecessary people outside of the test bay and ensure that people are well clear of the any rotating components.
The team may elect to have a driver inside the vehicle for this section if required. The driver needs to be in full race gear and must be able to egress the vehicle safely in the event of a fire, so pay attention to the height and stability of the vehicle and any obstructions in the inspection bay.

				Reinspect	Passed
THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.7.1	Ready to Drive	Only closing the shutdown circuit must not set the car to ready-to-drive mode. The car is ready to drive as soon as the motor(s) will respond to the input of the torque encoder/ acceleration pedal	Ask team to demonstrate		
FT.7.2		Additional actions are required by the driver to set the car to ready-to-drive-mode e.g. pressing a dedicated start button, after the tractive system has been activated. One of these actions must include the brake pedal being pressed as ready-to-drive-mode is entered. It must be possible for the vehicle to be powered on, with the high voltage on, but with the vehicle not in drive. It is not acceptable for the action of the driver putting the vehicle in drive to simultaneously turn on the HV System and engage drive.	Ask team to demonstrate		
FT.7.3		The car must make a characteristic sound, once but not continuous, for at least 1 second and a maximum of 3 seconds when it is ready to drive The sound level must be a minimum of 70dBA, fast weighting, in a radius of 2m around the car The used sound must be easily recognizable. No animal voices, song parts or sounds that can be interpreted as offensive will be accepted	Ask team to demonstrate		
FT.7.4		Pressing the accelerator gently must cause the vehcile's wheels to rotate. Check all of the vehicle's driven wheels turn in the correct direction.	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

DRIVER INPUT PLAUSIBILITY CHECKS				Reinspect	Passed
THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.8.1	Torque Encoder / Brake Pedal Plausibility Check	Torque encoder is at more than 25% and brake is actuated simultaneously. The motors have to shut down. The motor power shut down has to remain active until the torque encoder signals less than 5% pedal travel, no matter whether the brake pedal is still actuated or not. 1. Ask the team to spin the motors by pressing the accelerator pedal. 2. While the wheels are spinning, ask the team to depress the brake pedal. 3. The wheels must stop turning and the torque (current) to the motors should immediately fall to zero 4. Ask the Team to release the brake pedal while continuing to hold the accelerator pedal down. The wheels must not turn. 5. Ask the team to completely release the throttle pedal and press it again. 6. The wheels may now turn.	Ask team to demonstrate		
FT.8.2	Torque Encoder Plausibility Check	If an implausibility occurs between the values of two torque encoder sensors the power to the motor(s) has to be immediately shut down completely. It is not necessary to completely deactivate the Tractive System, the motor controller(s) shutting down the power to the motor(s) is sufficient Implausibility is defined as a deviation of more than 10% pedal travel between the sensors If three sensors are used at least two sensors have to be within 10% pedal travel, etc. 1. Check that driven axles turn by pressing the accelerator pedal 2. Disconnect at least 50% of the sensors and check that the power to the motors is shut down The sensor should be disconnected while the axles are turning. There must be no uncommanded throttle surges when the sensors are unplugged.	Ask team to demonstrate		
FT.8.3		Repeat the above disconnecting the other throttle sensors.	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

DRIVER INPUT PLAUSIBILITY CHECKS				Reinspect	Passed
THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.9.1	Brake System Plausibility Device (BSPD)	A standalone non-programmable circuit must be used on the car such that when braking hard (without locking the wheels) and when a positive current is delivered from the motor controller (a current to propel the vehicle forward), the AIRs will be opened. The current limit for triggering the circuit must be set at a level where 5kW of electrical power in the DC circuit is delivered to the motors at the nominal battery voltage. The action of opening the AIRs must occur if the implausibility is persistent for more than 0.5s. The team must devise a test to prove this required function during Electrical Tech Inspection. However, it is suggested that it should be possible to achieve this by sending an appropriate signal to the non-programmable circuit that represents the current to achieve 5kW whilst pressing the brake pedal to a position or with a force that represents hard braking. The preferred method for testing the BSPD system involves passing actual current from an external supply through the tractive system current sensor while the driver presses the brake pedal. Alternative test methods will require approval from the EV Technical Inspection Captain. The test must be an end to end test, meaning it is not acceptable for the team to simulate the 5kW by simulating the output of the current sensor, or using a substitute current sensor.	Visual Inspection If required, ask team to show BSPD Schematic. Ask team to demonstrate		
FT.9.2		The Brake Plausibility Device may only be reset by power cycling the GLVS Master Switch or via a RESET button, located out of reach from the driver	Ask team to demonstrate		

EV CLASS - FUNCTIONAL TEST

ENERGY METER TEST The energy meter test needs to be done by the Energy Meter Captain.				Reinspect	Passed
THE VEHICLE SHOULD BE ASSUMED TO BE LIVE AT ALL TIMES					
FT.10.1	Energy Meter Test	Energy Meter Captain has laptop connected	Ask team to demonstrate		
FT.10.2		Switch on the GLVMS and check the datalogger will communicate with the laptop	Ask team to demonstrate		
FT.10.3		Switch on the tractive system and rotate the wheels such that sufficient power is delivered to the motors to register on the energy meter.	Ask team to demonstrate		
FT.10.4		The energy meter must show both positive voltage and correct current flow direction.	Ask team to demonstrate		
ASK THE TEAM TO TURN OFF THE VEHICLE, REMOVE THE HVD AND RE-LOCK THE TSMS LOCKOUT.					

SEAL TS COMPONENTS				Reinspect	Passed
FT.11.1	Seal Tractive System components	Seal all important parts with tamper proof tape after the IMD test was passed successfully: i.e. Accumulator container, motor controller housings and any other enclosures containing Tractive System Voltage. Record items sealed:	Seal Items		

EV CLASS - FUNCTIONAL TEST

NOTES

INSTRUCTIONS FOR SCRUTINEERS - END OF EV FUNCTIONAL TEST
If the team have passed all items in this section, go to the second page of this document and initial the relevant box, noting the date and time the team passed this section. Give the team their EV FUNCTIONAL sticker - the team may proceed to the next inspection station. If the team have items requiring reinspection (did not pass all items), go to the second page of this document and initial the relevant box noting the time and date the team was released from the inspection. The team will need to rectify the reinspection items and may return for reinspection when they are ready. Reinspection is completed on a first come, first served basis, and is dependent on Technical Inspection lane availability. Teams with Scheduled Inspections times will be given priority over teams presenting for reinspection. Once the team have been released from the inspection, make note of the team's progress on the central inspection record board.
